Operating Instructions
017186-1000

Level Probe
multicap DC 16

Partially insulated rod probes

Applications
The Multicap DC 16 probe is primarily designed for limit detection in liquids. The wide selection of corrosion-resistant materials used ensures that it can also withstand extremely corrosive products. The tried-and tested, rugged construction is gas-tight for pressures from vacuum to 100 bar (1450 psi) gauge.
Seal and insulation materials enable it to be used with operating temperatures in the vessel of –80 °C up to +200 °C (–110 °F to +390 °F).

Your benefits

- Optimum adaptation to your application thanks to a wide range of process connections and practical variations
  = reliable function at a cost-effective price
- Protection against condensation in the nozzle
  = reliable function even with condensation
- Active build-up compensation for limit detection
  = constant and accurate switchpoint even with heavy build-up on the probe, no cleaning or recalibration required

Endress+Hauser
The Power of Know How

Measuring System

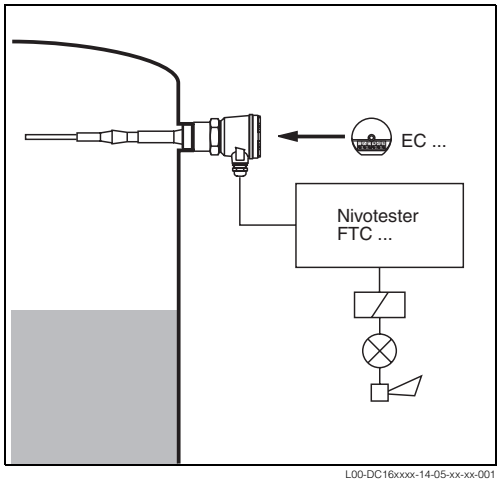
The measuring system consists of:

- Multicap DC 16 probe
- EC... electronic insert in the probe housing
- Nivotester FTC (Z) level limit detector or Silometer FMC (Z) level transmitter.

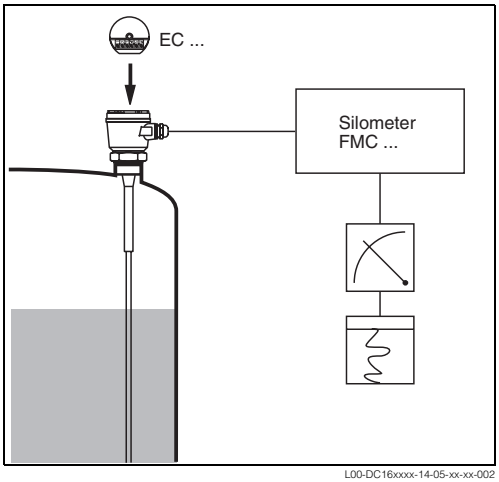
For limit detection in liquids with heavy build-up or for detecting interface layers, the measuring system consists of:

- Multicap DC 16 probe with active build-up compensation
- EC 16 Z electronic insert
- FTC 520/521 Z or FTC 470/471 Z level limit switch.
  The limit input of the Silometers FMC 671 Z can also be connected.

Measuring system and application



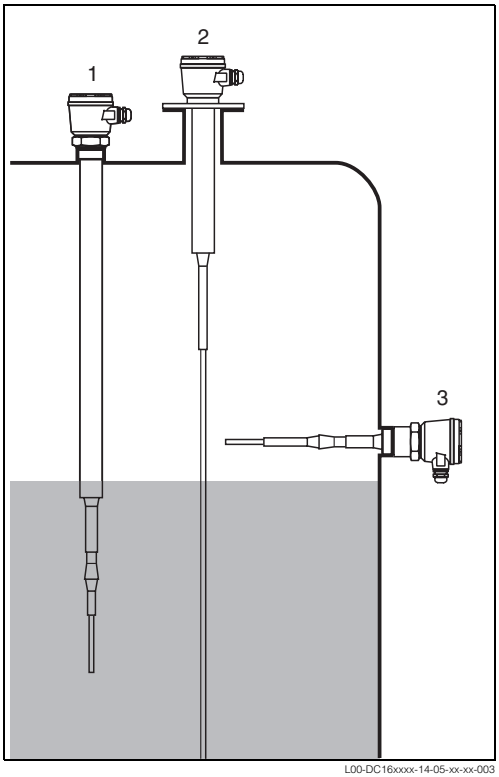
Level limit detection



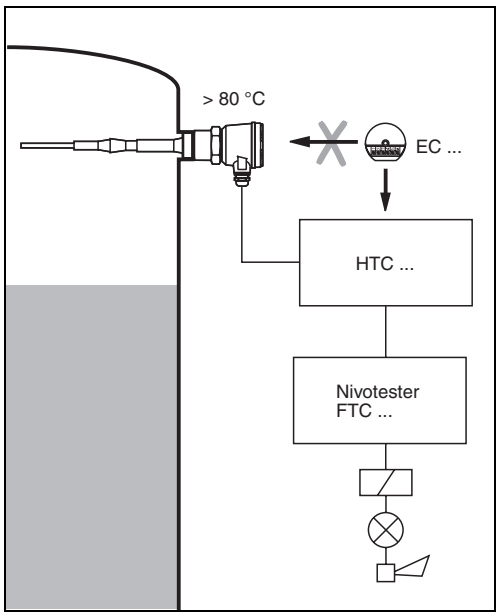
Continuous level measurement

Three examples for the use to Multicap DC 16 probes:

1) Probe with a combination of screening and active build-up compensation for separation layer detection
2) Probe with screening against condensation in the ounting pipe in the tank roof
3) Probe with active build-up compensation for reliable limit detection despite extreme build-up



Separate mounting of the electronic insert with an excessively high ambient temperature for the probe head housing

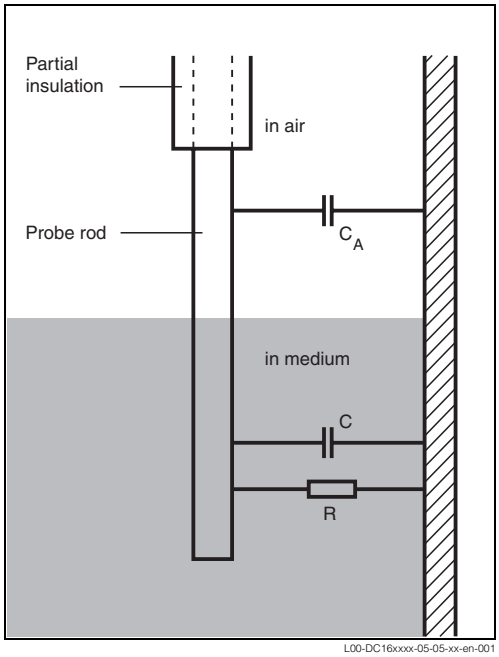


Certified applications

Please note all specifications in the certificates and appropriate regulations as well as the instructions given in this Technical Information.

Operating Principle

The probe and vessel wall or counter electrode form a capacitor with a defined low capacitance when the probe is in air.
As soon as material covers the probe a parallel circuit is formed consisting of a much larger capacitance and the resistance of the material – the impedance.
In the case of limit detection with partially insulated probes, this means that for materials with conductivities greater than a given, very low threshold, any change in dielectric constant, and thus of conductivity, has no effect on the switchpoint.
On the other hand, this means that it is not possible to use partially insulated probes for continuous level measurement in electrically conducting materials.
Screening on the probe prevents effects caused by build-up of material or condensation in the vicinity of the process connection. Probes with active build-up compensation for limit switching cancel out effects of build-up on the probe.



Simplified circuit diagram showing capacitance measurement with partly insulated probes

Probe Selection

Here are just a few notes on the various designs for the partially insulated Multicap DC 16 probe

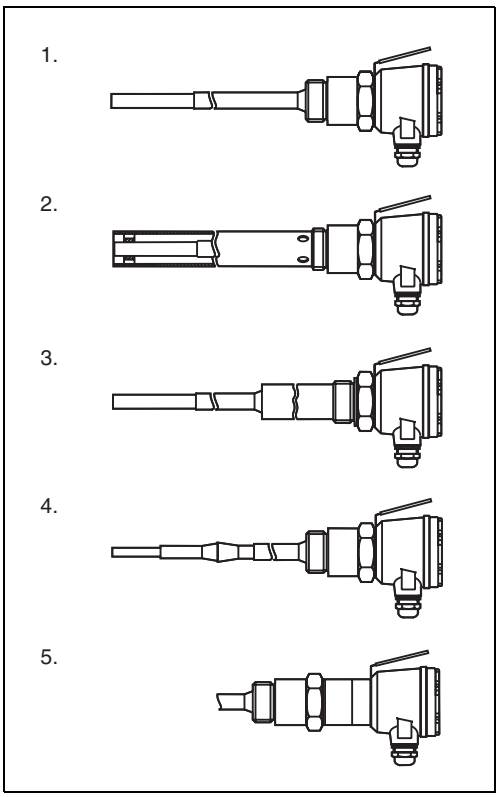
1. Probe without ground tube
- for limit detection in conductive liquids
- for high viscosity liquids
- for bulk solids

2. Probe with ground tube
- for non-conductive liquids
- for use in agitator vessels

3. Probe with screening
- for long nozzles
- for condensation on the roof of the vessel
- for build-up on the vessel wall

4. Probe with active build-up compensation for limit detection
- with heavy (conductive) build-up on the probe.
  The active build-up compensation of the Multicap DC 16 probe is always gas-tight due to the self-adjusting tapered gasket. A wide range of corrosion-resistant materials ensures that they can be used with aggressive products.

5. Probe with gas-tight gland
- for liquefied gas tanks (required in Germany)
- to prevent condensation forming in the probe on extreme temperature variations. See also temperature graphs overleaf.

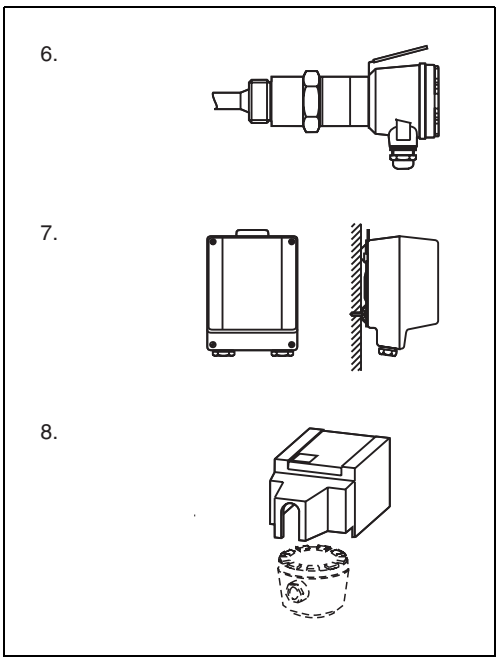


L00-DC16xxxx-03-05-xx-xx-000

6. Probe with temperature spacer
- for an extended range of operating temperatures in the vessel. See also temperature graphs overleaf.

7. Probe without electronic insert
- for high temperatures in the probe housing: Use electronic insert in separate housing. See also temperature graphs overleaf.

8. Probe with protective cover (accessory)
- to prevent condensation forming in the aluminium standard housing.



L00-DC16xxxx-03-05-xx-xx-001

Further variations outside the product tank

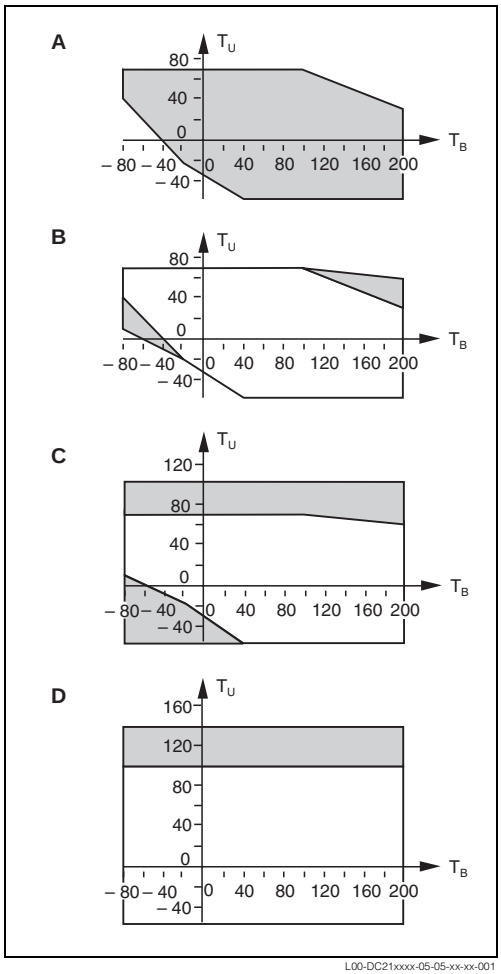
Electronic Insert

Separate or integrated?

Information is provided by the graphs on the right.
The horizontal axis is the operating temperature T_B in the vessel.
The vertical axis is the ambient temperature T_U of the probe housing (in °C).

- Do the temperatures lie in the grey area of graph **A**?
  The electronic insert may be mounted in the housing of any probe.
- Do the temperatures lie in the grey areas of graph **B**?
  The electronic insert may be mounted in the housing of a probe with a temperature spacer or gas-tight gland; or it may be mounted in a separate housing.
- Do the temperatures lie in the grey areas of graph **C**?
  The electronic insert should be mounted in a separate housing.
- Do the temperatures lie in the grey area of graph **D**?
  Use a probe with a temperature spacer or a gas-tight gland and mount the electronic insert in a separate housing.

x °C = (x •1.8 + 32) °F



Application range of the various types as a function of operating and ambient temperature

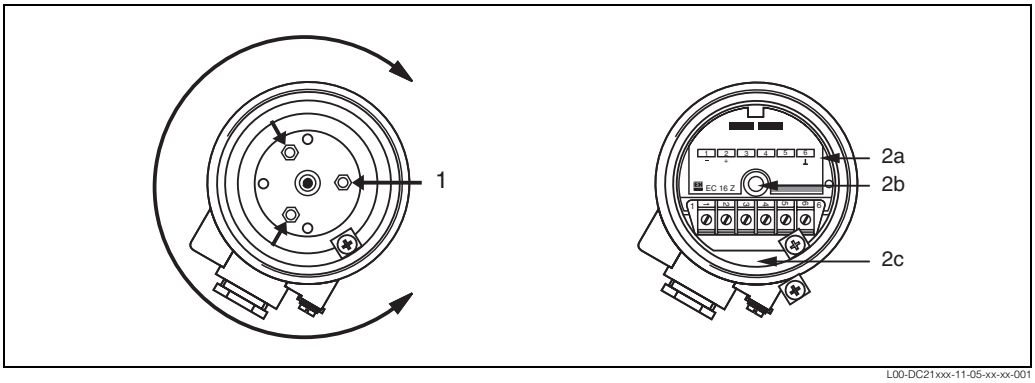
Transport, Unpacking

- To avoid damage to the probe, remove the packaging on-site just before mounting.
  The uninsulated section of probes with active build-up compensation is covered with plastic webbing. This protection should be removed prior to mounting.
- Compare the code on the nameplate of the probe with the product designation on Page 13 to ensure that the correct probe has been delivered.
- Check the probe length. The probes can be shortened easily by sawing.
  Minimum lengths for the probe rod and insulation are given in the project information.

Installation

- Probe with parallel thread G 1 ½ A:
  Use the elastomer/fibre seal provided or any other chemically resistant seal which can withstand temperatures up to 300 °C (570 °F).
- Probe with tapered thread 1 ½ - 11 ½ NPT:
  If required, wrap suitable sealing material around the thread.
- Probe with flange connection:
  Use a sealing material suitable for the application.
  If the flange is PTFE-clad, then this is generally a suitable seal up to the permitted operating pressure.
- Make sure that the probe insulation is not damaged when sliding the probe through the threaded sleeve or nozzle with counter-flange.
- When tightening, turn the probe with threaded boss at the hex nut only; not at the housing!
- For probes with the G 1 ½ A thread and seal:
  – a torque of 300 Nm is sufficient to seal tight against a pressure in the vessel of up to 50 bar (725 psi).
  – a torque of 530 Nm is sufficient to seal tight against a pressure in the vessel of up to 100 bar (1450 psi).
  Maximum admissible torque: 600 Nm
- A polypropylene threaded boss with rubber seal may only be tightened using a max. torque of 7 Nm (1 Nm = 0.74 ft lbs).

Rotating the Housing



L00-DC21xxx-11-05-xx-xx-001

1) The housing can be rotated after the 3 nuts have been loosened
2) Tighten electronic insert (a) with the central slotted nut (b) leaving space (c) for the connecting cable

The housing can be rotated if the cable gland is pointing in the wrong direction after mounting.

To loosen:
– Unscrew the housing cover
– Unscrew the central nut (slotted nut) in the electronic housing
– Remove the electronic insert from the housing
– Slightly loosen the 3 nuts (7 AF), see Figur.

To rotate: – The housing can now be rotated in any direction.
When mounting the probe from the side, the cable entry should be facing downwards so that no moisture can enter.

To tighten: – Securely tighten the 3 nuts in the housing so that the housing is tight against the hex nut.
– Insert the electronic insert and securely tighten the central nut so that it does not become loose. Ensure that the cable gland remains free.

Connection

Refer to the appropriate Technical Information concerning the electronic insert EC... used in the probe housing.
In the case of the heavy duty housing, the connection diagram corresponds to that of the built-in electronic insert. If is important that no moisture enters the probe housing during storage of the probe, connection of the electronic insert and during operation. Always tighten the housing cover and cable gland securely.

If the probe is installed in a plastic tank, connect the ground terminal of the probe to the counter-electrode using a short cable.

Replacing components

Mounting without electronic insert
Exchange of electronic inserts

- After the defective electronic insert has been removed and the replacement properly installed, the instrument must be recalibrated and checked for correct function.
- If fully insulated multicap probes are mounted in explosion hazardous areas without the electronic insert, and there is a risk of dangerous electronic discharges, then the probe terminal in the housing must be short-circuited with the ground terminal.

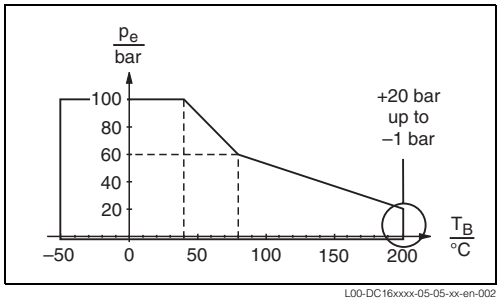
Technical Data

Operating data

Permitted operating pressures p_e and temperatures T_B.

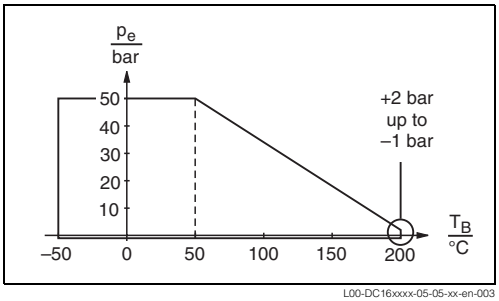
Temperature T_B: x °C = (x •1.8 + 32) °F
Pressure p_e: 1 bar = 14.5 psi

See the following graphs for the relationship between operating pressure and temperature:



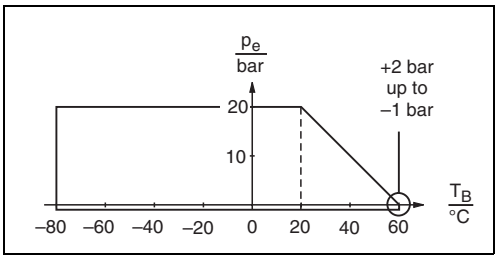
L00-DC16xxxx-05-05-xx-en-002

Insulation PTFE or PFA
Does not apply to:
– probes with active build-up compensation
– Monel



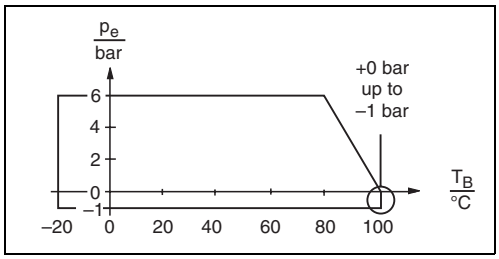
L00-DC16xxxx-05-05-xx-en-003

Insulation PTFE or PFA
Applies to
probes with active build-up compensation



L00-DC16xxxx-05-05-xx-en-004

Insulation PE



L00-DC16xxxx-05-05-xx-en-005

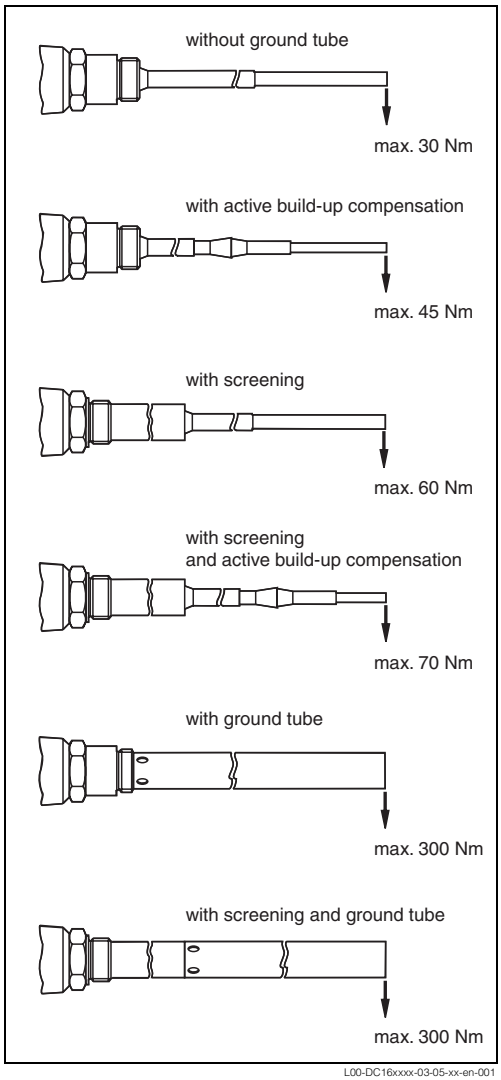
Probe with polypropylene threaded boss and rubber seal

- Capacitance values of the probe
  Ground capacitance: approx. 30 pF

  Other capacitance values
  Gas-tight gland: approx. 20 pF
  Temperature spacer: approx. 20 pF
  Active build-up compensation: approx. 10 pF
  Screening: approx. 3 pF/100 mm

  Probe is 250 mm from a conductive vessel wall
  Insulated probe rod: approx. 1.3 pF/100 mm
  Uninsulated probe rod:
  approx. 1.3 pF/100 mm

  Probe in ground tube
  Insulated probe rod: approx. 5.5 pF/100 mm
  Plain probe rod: approx. 5 pF/100 mm
- Lateral load bearing capacity of the probe
  see graphs on the right



L00-DC16xxxx-03-05-xx-en-001

Lateral load bearing capacity for the probe at 20 °C (70 °F) and static load

1 Nm = 0.74 ft lbs

Probe lengths
(100 mm = 3.94 in)

- Total length of probe: L max. 6000 mm
- Length of screening: L3 min. 100 mm, max. 4000 mm
- Length of active probe rod: max. 4000 mm
- Length of partial insulation: L2 min. 75 mm, max. probe rod length minus 50 mm
- Length of active build-up compensation: always 150 mm from where the probe rod leaves the process connection or screening
- Length tolerances
  up to 1 m: +0 mm, – 5 mm
  up to 3 m: +0 mm, –10 mm
  up to 6 m: +0 mm, –20 mm

Process connection standards

- Parallel thread G 1 ½ A: DIN ISO 228/I, with sealing ring 48 x 55 conf. to DIN 7603
- Tapered thread 1 ½ - 11 ½ NPT: ANSI B 1.20.1
- DIN flanges: see flange table
- ANSI flanges: ANSI B 16.5
- Sanitary thread: DIN 11851
- Triclamp coupling: ISO 2852

Materials

Most material specifications are given in the product structure on Page 13

- Aluminium housing: cast aluminium AlSi 12, resistant to sea water, EP lacquered
- Aluminium housing, coated: in fluoropolymer
- Sealing between housing and process connection: EPDM
- Sealing for housing cover: O-ring in EPDM
- Temperature spacer: SS 304 H
- Gas-tight gland: SS 304 H
- Sealing ring for process connection G 1 ½ A: elastomer/fibre, non-asbestos, resistant to oils, solvents, steam, weak acids and alkalis up to 300 °C and 100 bar (570 °F and 1450 psi)
- Cable entrys: standard Pg in nickel-plated brass with NBR seal for cable diameter 7...10 mm; Protection IP55; ambient temperature up to 100 °C (210 °F)
- Water-tight Pg in polyamide with neoprene/CR seal for cable diameter 7...12 mm; Protection IP66; ambient temperature up to 80 °C (180 °F)

See product structure for housing variations.
