

# Electromagnetic Flow Measuring System

## *promag 30 (Model '99)*

### Flexible System

- Wide choice of materials for process connections and measuring tube linings, compatible to the fluid
- Transmitter housing and display can be rotated to fit the orientation

### Operational Security

- ISO 9001 manufacturer
- High electromagnetic compatibility (EMC)
- High operating integrity through self-monitoring
- Data protection with EEPROM on power failure (without batteries)
- Auxiliary input for Positive Zero Return (PZR) and totalizer reset
- Empty Pipe Detection (EPD)

### Easy to Operate

- Local display: all important variables easily read off
- E+H operating matrix: instrument functions easily configurable

### Measure Precisely

- Measuring error:  $\pm 0.5\%$  or  $\pm 0.2\%$
- 1000:1 operable flow range
- Excellent repeatability

### Install Anywhere

- Robust, shock-resistant aluminium housing, resistant to acids and caustics
- IP 67 protection for compact and remote versions (optional IP 68 sensor)
- Wide size range DN 2...2000 ( $1/12$ ...78")
- Flanged version with ISO meter lengths
- Modular, hygienic sensor for food and pharmaceutical applications
- Ex versions for use in Ex Zones 1 and 2

Endress + Hauser

Nothing beats know-how

# Measuring System

## Fields of Application

With the Promag 30 (Model '99) flow-meter most liquids can be measured provided they have a minimum conductivity of  $\geq 5 \mu\text{S}/\text{cm}$ , e.g.

- acids, alkalis, pastes, pulps,
- drinking water, waste water, sewage sludge,
- milk, beer, wine, mineral water, yoghurt, molasses, etc.

A minimum conductivity of  $\geq 20 \mu\text{S}/\text{cm}$  is required for measuring demineralised water.

## Ex Versions

Promag 30 (Model '99) is available as a remote version with the following Ex approvals:

- Sensor in Ex Zone 1
- Transmitter in Ex Zone 2

## Measuring System

The measuring system consists of:

- Promag 30 (Model '99) transmitter
- Promag A, H or F sensor

The Promag 30 measuring system is mechanically and electronically designed for maximum flexibility with the transmitters and sensors being combined in any variation. The wide range of materials and process connections (fittings; flanges DIN, ANSI, JIS; Tri-Clamp, etc.) ensure that the measuring point can adjust to both plant and process conditions.

## The Promag 31 F / 31 H Measuring System

The Promag 30 is also available under the following designations and approvals:

### Promag 31 F

- PTB approval for custody transfer with cold water and wastewater (either for approval or approved for custody transfer)
- Heat measurement approval, Swiss certification to OIML R72/R75

### Promag 31 H

- PTB approval to DIN 19217 (OIML 117) for custody transfer with beer, original wort, milk.

# Function

## Measuring Principle

According to Faraday's Law of Magnetic Induction, a voltage is induced into a conductor which moves in a magnetic field. With the electromagnetic measuring principle, the flowing fluid is the moving conductor. The induced voltage is proportionally related to the flow velocity and is fed to the measuring amplifier by a pair of electrodes. Using the pipe cross-sectional area, the flow volume is calculated.

The DC magnetic field is generated by a switched direct current of alternating polarity. Together with the patented "Integrated Autozero Circuit", this guarantees a stable zero point, and makes the measurement fluid-independent and insensitive to entrained solid particles. Every meter is factory calibrated with the most modern calibration rigs, traceable to national standards.

## Function of the Promag 30 (Model '99)

The Promag transmitter converts the measured values coming from the sensor into standardised output signals. The following outputs are available for these signals:

- Current output (full scale value freely selectable)
- Pulse output (pulse value freely selectable)
- Status output:
  - Indication of system or process errors
  - Indication of flow direction
- Auxiliary input:
  - Positive zero return
  - Totalizer reset

Promag 30 also has the following features:

- Empty Pipe Detection (EPD) detects and indicates partially filled or empty measuring tubes.
- The special electrode cleaning circuitry (EEC) ensures accurate flow measurement even with conductive build-up in the measuring tube (e.g. magnetite).

# Operation

## Display and Operation

The Promag 30 measuring system is equipped with a large local display. This ensures that all important variables can be read off and controlled directly at the measuring point:

- Flow rate and/or totalized flow
- Technical units
- Process conditions:
  - falling below creep limit
  - signal outputs exceeded
- Display of system errors

Three operating keys are used for selecting and setting all functions of the instrument.

The E+H operating matrix allows quick and easy access to all individual functions.

## Functions (Operating matrix)

### User interface

- Function code (display)
- Flow rate units
- Totalizer units

### Current output

- Full scale value (freely adjustable)
- Time constant (freely selectable)
- Current range 0/4...20 mA

### Pulse output

- Pulse value (freely adjustable)

### Status output

- Function

### Auxiliary input

- Function

### Display

- Totalizer reset
- Display mode
- Display damping
- Totalizer overflows

### Process parameter

- Creep suppression
- Empty Pipe Detection (EPD)
- Electrode cleaning (ECC), optional

## Diameter Selection

As a rule, the pipe diameter determines the sensor nominal diameter.

A necessary increase in velocity can be achieved through a reduction of the sensor diameter (see page 8). The higher installation expense is normally balanced by the lower sensor cost.

The flow velocity (v) is also to be determined by the fluid's physical properties:

- v < 2 m/s: with abrasive fluids, e.g. potter's clay, lime milk, ore slurry
- v > 2 m/s: with fluids causing build up, e.g. wastewater slurry etc.

The table below summarizes the minimum and maximum end values (incl. factory settings).

Full scale values (current output)								
DN	l/s			m <sup>3</sup> /h		USgpm		
	Min.	Factory setting	Max.	Min.	Max.	Min.	Factory setting	Max.
2	0.00094	0.008	0.031	0.0034	0.1131	0.015	0.1	0.498

1350	429.4	3500	14313	1546	51530	6806	55000	226880
1400	461.8	4000	15393	1663	55418	7320	60000	243997
1500	530.1	4500	17671	1909	63617	8403	70000	280098
1600	603.1	5000	20106	2172	72382	9561	80000	318690
1700	680.9	5500	22698	2451	81713	10793	90000	359771
1800	763.4	6500	25447	2748	91609	12100	100000	403342
2000	942.4	8000	31416	3393	113097	14939	100000	497953

Minimum full scale → flow rate = 0.3 m/s  
 Maximum full scale → flow rate = 10 m/s  
 Factory settings → flow rate ~ 2.5 m/s (I = 20 mA)

# Mounting

In order to measure correctly and to prevent damage, please observe the following installation instructions.

## Mounting Position

### Vertical mounting:

This is the recommended position with the flow upwards. Entrained solid particles sink and fatty components in the stationary fluid rise away from the measuring electrodes. This is the optimal position in empty pipe system and when using Empty Pipe Detection.

### Horizontal mounting:

The axis of the electrodes must be horizontal, thus preventing brief insulation of the electrodes by entrained air bubbles.

### Electrode axis:

The plane in which the electrode axis lies with regard to the transmitter is identical for the Promag A, H and F sensors.

## Inlet and Outlet Sections

The sensor should be mounted away from fittings such as valves, T-pieces, elbows, etc.

Inlet section:  $\geq 5 \times \text{DN}$

Outlet section:  $\geq 2 \times \text{DN}$

The inlet and outlet sections must be observed in order to maintain accuracy.

## Vibration

The piping before and after the sensor should be securely fastened if there is excessive vibration. Information on shock and vibration resistance is found on page 24.

Excessive vibration necessitates separate mounting of the sensor and transmitter.

Mechanical support of the sensor is recommended for free runs of piping over 10 m long.

### Mounting Location

Correct measurement is only possible when the pipe is full. The following locations should therefore be avoided:

- No installation at the highest point (air accumulation).
- No installation immediately before an open pipe outlet in a downward line. The alternative suggestion, however, permits such a location.

The alternative installation, however, permits a correct measurement.

### Partly Filled Pipes

For inclines a mounting similar to a drain should be adopted.

Added security is offered by Empty Pipe Detection in order to detect empty or partly filled pipes.

Note!

Danger of solids accumulation!  
Do not mount the sensor at the lowest point of the drain. A cleaning valve should also be installed.

### Downward Pipe

With the installation suggested opposite, partial vacuum is avoided even with a downward pipe > 5 m long (siphon, vent valve downstream of the sensor).

### Installation of Pumps

Do not mount the sensors on the suction side of pumps.

This prevents low pressure and prevents possible damage to the lining of the measuring tube.

Pulse dampers should be installed when using reciprocal, diaphragm or peristaltic pumps.

# Mounting

## Adapters

The sensor can also be mounted in a pipe with a larger nominal diameter when suitable adapters (reducers and expanders) to DIN 28545 are fitted. The resultant increase in the rate of flow increases the accuracy of measurement with slowly moving fluids.

The adjacent nomogram can be used to determine the pressure loss caused:

1. Determine the ratio of the diameter  $d/D$ .
2. From the nomogram read off the pressure loss at the flow velocity and  $d/D$  ratio.

Note!

The nomogram applies to fluids with a viscosity similar to that of water.

## Remote Version

Two different versions are available for the remote version:

### FS version

- The permissible cable length greater than 10 meters is governed by the fluid conductivity (see Fig.).
- Permissible cable length of max. 10 meters if the instrument is equipped with an Empty Pipe Detection (EPD) electrode.
- The FS cable is recommended only for distances smaller than 20 m.

### FL version

- All fluids with a minimum conductivity of  $\geq 5 \mu\text{S/cm}$  (demineralised water  $\geq 20 \mu\text{S/cm}$ ) can be measured independent of the cable length.
- Empty Pipe Detection (EPD) is not available with this version.

Please also note the following:

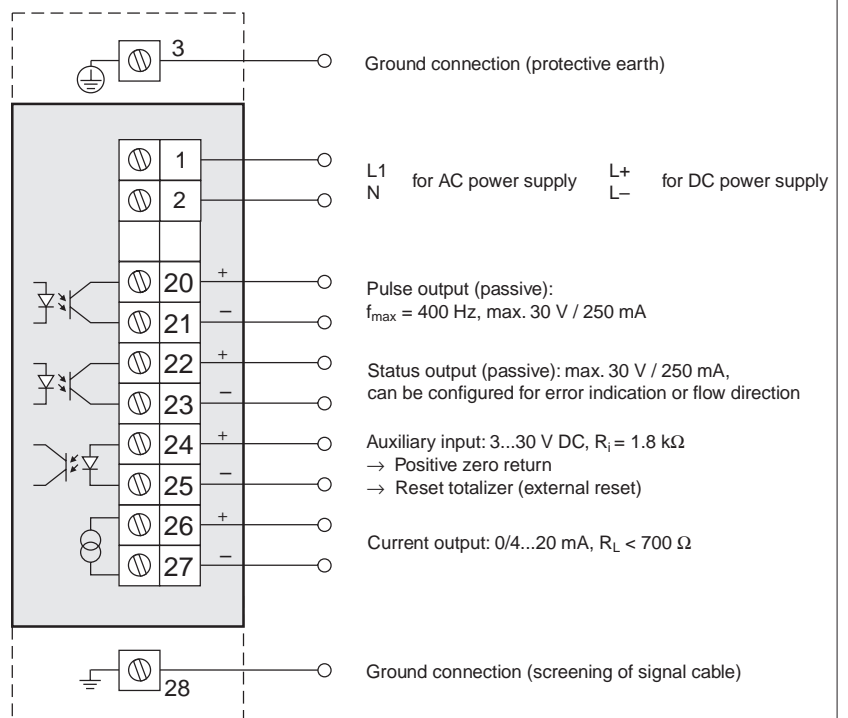

- Fasten the cable gland or lay it in a conduit. When the fluid conductivity is low, cable movements can cause serious changes in capacitance and thereby falsify the measuring signal.
- Do not run the cable in the vicinity of electrical machines or switching elements.
- Ensure potential equalisation between the transmitter and the sensor.

Remote version has to be mounted when:

- access is difficult
- space is restricted
- extreme process and ambient temperatures prevail (see page 24)
- there is severe vibration (see page 24)

# Electrical Connection Transmitter

**Note!**

- Example connection diagrams for the pulse, current, status output and auxiliary input are given on the following page.
- The input and outputs for the power supply are galvanically separated from one other.

# Electrical Connection Examples

## Pulse output

## Relay / mechanical counter

## Status output

## Relay

## Auxiliary input

## Current output as a power supply source

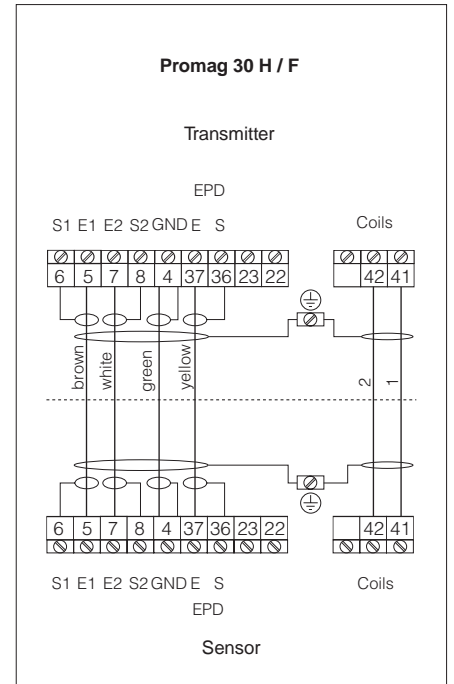

If the current output is not required, then this can be used as a power supply. Set the current output to 4–20 mA.

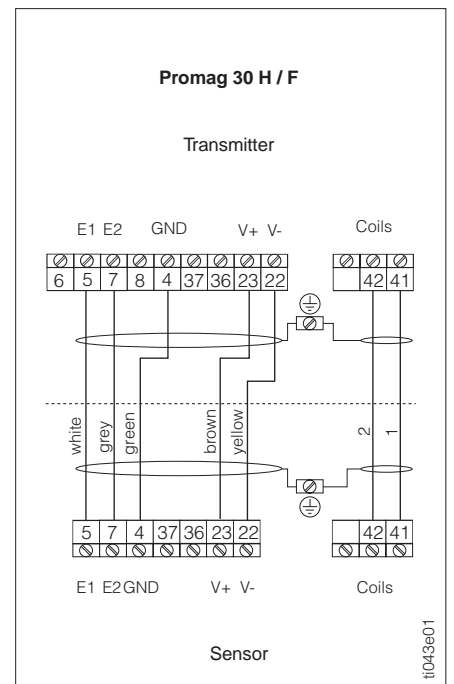

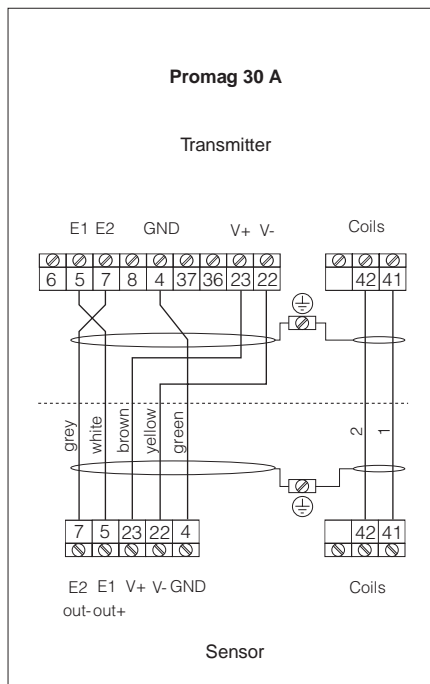

**Caution!**  
Carefully note the specifications required for inputs and outputs (see page 22)

# Electrical Connection Remote Version

## FS Version

## FL Version

ti043e01

## Cable Specifications

### Remote Version "FS"

Coil cable: 2 x 0.75 mm<sup>2</sup> PVC cable with common screen \*  
Conductor resistance ≤ 37 Ω/km  
Capacitance: core/core, screen grounded ≤ 120 pF/m

Signal cable: 3 x 0.38 mm<sup>2</sup> PVC cable with common screen \*  
and separately screened cores  
With EPD (Empty Pipe Detection) 4 x 0.38 mm<sup>2</sup> PVC cable  
Conductor resistance ≤ 50 Ω/km  
Capacitance: core/screen ≤ 420 pF/m

Permanent operation temperature: -20...+70 °C

\* braided copper screening: Ø ~ 7 mm

### Remote Version "FL"

Coil cable: 2 x 0.75 mm<sup>2</sup> PVC cable with common screen \*  
Conductor resistance ≤ 37 Ω/km  
Capacitance: core/core, screen grounded ≤ 120 pF/m

Signal cable: 5 x 0.5 mm<sup>2</sup> PVC cable with common screen \*  
Conductor resistance ≤ 37 Ω/km  
Capacitance: core/core, screen grounded ≤ 120 pF/m

Permanent operation temperature: -20...+70 °C

\* braided copper screening (coil cable Ø ~ 7 mm; signal cable Ø ~ 9 mm)

### Operation in Areas with Severe Electrical Interference

The Promag 30 measuring system fulfils all general safety requirements according to EN 61010 and electromagnetic compatibility (EMC) according to EN 50081 Part 1 and 2 / EN 50082 Part 1 and 2 when installed in accordance with the NAMUR recommendations.

Note!

- With the remote-mounted version the signal and coil cables between sensor and transmitter must always be screened and grounded at both ends.
- The cable must be resistant to an ambient temperature of max. +80 °C if the Promag H is operated at a process temperature of +150 °C.

# Potential Equalisation

The sensor and the fluid must have roughly the same electrical potential to ensure that measurement is accurate and no galvanic corrosion takes place at the electrode. Normally the reference electrode in the sensor or the metal pipe ensures that the potentials are equalized.

## Reference electrodes:

Promag A:  
Always with reference electrode

Promag F:  
Optional, depending on material

Promag H:  
No reference electrode, as there is always a metallic connection to the fluid.

If the reference electrode is correctly grounded and the fluid flows through metallic, unlined and grounded piping, then it is sufficient to connect the grounding terminal of the Promag 30 transmitter housing to the potential equalisation line in order to prevent corrosion. The connection with the remote-mounted version is made at the ground terminal of the connection housing.

## Caution!

Danger of permanent damage to the instrument! If the fluid cannot be grounded for operational reasons, ground disks are to be used.

## Potential Equalisation for Lined Pipes with Cathodic Protection

When the fluid cannot be earthed for operational reasons, the measuring unit must be installed that it is potential-free. Ensure that components of the piping are connected to one another (copper wire, 6 mm<sup>2</sup>).

All national regulations regarding potential free installation are to be observed (e.g. VDE 0100). Ensure that the mounting material used does not result in a conductive bond with the measuring unit and that the material can withstand the tightening torque used.

## Potential Equalisation

### Plastic or Lined Piping

Ground disks must always be used with non-conductive piping materials if compensation currents flow through the fluid. They can irreparably damage the reference electrode within a short time due to electrochemical corrosion.

Such conditions occur especially if:

- the piping is insulated with electrically non-conductive materials and
- the piping is made of fibreglass or PVC through which flow highly concentrated acids and alkalis.

Caution!

Danger from damage due to electrochemical corrosion!

- Note the corrosion resistance of the ground disks.
- Note the electrochemical potential series in cases where the ground disks and the measuring electrodes are made of different material.

### Equalising Currents in Unearthed Metal Pipes / Earthing in an Area with Severe Interference

The fluid may be earthed. In order to make the most of the electromagnetic compatibility (EMC) of the Promag 30, it is advisable to provide two flange-to-flange links and to connect them jointly with the transmitter housing to earth potential.

# Material Load Curves (p-T-Diagrams)

## Promag A

DIN 2413 and 2505

Flange material: Steel 1.4404/1.4435, PVDF, PVC

## Promag H

Welded nipple material: Steel 1.4404/316L

## Promag F

DIN 2413 and 2505

Flange material: Steel 37.2

## ANSI B16.5

Flange material: Steel A105

DIN 2413 and 2505

Flange material: Stainless steel 1.4571

## AWWA C 207, Class D

Flange material: Steel A105

## ANSI B16.5

Flange material: Steel 316L

## JIS B2210

Flange material: S20C / SUS 316L

# Technical Data

<b>Application</b>	
<i>Instrument name</i>	Flow measuring system "Promag 30 (Model '99)"
<i>Instrument function</i>	Flow measurement of liquids in closed piping. Applications in measurement, control and regulation processes, for e.g. batching and dosing (> 10 s), etc.
<b>Function and system design</b>	
<i>Measuring principle</i>	Electromagnetic flow measurement according to Faraday's law (Generation of a voltage by induction in a magnetic field).
<i>Measuring system</i>	Instrument family "Promag 30 (Model '99)" consisting of: <ul style="list-style-type: none"> <li>• Transmitter: Promag 30</li> <li>• Sensor: Promag A (DN 2, 4, 8, 15, 25) Promag H (DN 25, 40, 50, 65, 80, 100) Promag F (DN 15...2000)</li> </ul> <p>Two versions are available:</p> <ul style="list-style-type: none"> <li>• Compact version</li> <li>• Remote version (FS or FL version)</li> </ul>
<b>Input variables</b>	
<i>Measuring variable</i>	Flow velocity (proportional to induced voltage. Measured by two electrodes in the measuring tube)
<i>Measuring range</i>	Measuring range of electronics within $v = 0 \dots 12.5$ m/s  The full scale value for the current output can be selected within the following limits (see also page 5): <ul style="list-style-type: none"> <li>– Minimum full scale value at <math>v = 0.3</math> m/s</li> <li>– Maximum full scale value at <math>v = 10</math> m/s</li> </ul>
<i>Operable flow range</i>	Over 1000 : 1 When the flow is pulsating, the amplifier is not overloaded above its set full scale value even with peak velocities of 12.5 m/s. Flow is measured between 0.01...> 10 m/s at the stated accuracy.
<i>Auxiliary input</i>	$U = 3 \dots 30$ V DC, $R_i = 1.8$ k $\Omega$ , galvanically isolated Configurable for positive zero return or totalizer reset.
<b>Output variables</b>	
<i>Output signal</i>	<ul style="list-style-type: none"> <li>• <i>Current output:</i> 0/4...20 mA, galvanically isolated, <math>R_L &lt; 700</math> <math>\Omega</math>, time constant selectable (0.5...95 s), full scale value freely selectable, temperature coefficient: typical 0.01% o.r./<math>^{\circ}</math>C; resolution: 10 <math>\mu</math>A</li> <li>• <i>Pulse output (transistor output):</i> passive, <math>f_{max} = 400</math> Hz, <math>U_{max} = 30</math> V, <math>I_{max} = 250</math> mA, galvanically isolated, pulse value selectable, pulse/pause ratio up to 0.5 Hz approx. 1:1 (the pulse width is limited to 1 s for pulse frequencies &lt; 0.5 Hz)</li> <li>• <i>Status output (transistor output):</i> passive, <math>U_{max} = 30</math> V, <math>I_{max} = 250</math> mA Can be configured for: <ul style="list-style-type: none"> <li>– indicating system errors (error), process errors (overflow, Empty Pipe)</li> <li>– flow direction indication</li> </ul> </li> </ul>

<b>Output variables (continued)</b>	
<i>Signal on alarm</i>	<ul style="list-style-type: none"> <li>• Current output: The current is set to a defined value</li> <li>• Pulse output: no signal supplied</li> <li>• Status output: on "Error" → not conducting (open) on "Flow direction" → last status held (forward → not conducting; backward → conducting)</li> </ul>
<i>Load</i>	$R_L < 700 \Omega$ (current output)
<i>Creep suppression</i>	Switch-on point at $v = 0.02$ m/s Switch-off point at $v = 0.04$ m/s Function can be switched off.
<b>Accuracy</b>	
<i>Reference conditions</i>	According to DIN 19200 and VDI/VDE 2641:  Fluid temperature $+28 \text{ }^\circ\text{C} \pm 2 \text{ K}$ Ambient temperature $+22 \text{ }^\circ\text{C} \pm 2 \text{ K}$ Warm up period                30 minutes  <i>Mounting:</i> – Inlet section > 10 x DN – Outlet section > 5 x DN – Transmitter and sensor are grounded. – The sensor is build-in centered into the piping.
<i>Measured error</i>	Pulse output: $\pm 0.5\%$ o.r. $\pm 0.01\%$ o.f.s. (full scale value = 10 m/s) Current output: additionally $\pm 10 \mu\text{A}$ (typical)  <div style="text-align: center;"> <p>Measured error [% o.r.]</p> <p>— 0.5% - - - 0.2% (Option)</p> <p>Fluid velocity [m/s]</p> </div> <p><i>Option:</i>            Promag 30 A and F: <math>\pm 0.2\%</math> o.r. <math>\pm 0.05\%</math> of <math>Q_k</math>  <math>Q_k</math> = desired reference flow quantity for calibration (<math>v = 2 \dots 10</math> m/s).  <math>Q_k</math> has to be noted for ordering.</p> <p>Deviations in power supply voltage have no influence on the specified ranges.</p>
<i>Repeatability</i>	$\pm 0.1\%$ o.r. $\pm 0.005\%$ o.f.s.  o.r. = of reading o.f.s. = of max. full scale value (see table on page 5)

<b>Operating conditions</b>	
<b>Installation conditions</b>	
<i>Installation instructions</i>	Orientation: vertical or horizontal Restrictions and other recommendations → see page 6 ff.
<i>Inlet and outlet sections</i>	Inlet section: $\geq 5 \times \text{DN}$ Outlet section: $\geq 2 \times \text{DN}$
<i>Connection cable length for remote version</i>	<p><b>FS version:</b> 0... 10 m → min. conductivity <math>\geq 5 \mu\text{S/cm}</math> 10...200 m → min. conductivity = <math>f(L_{\text{max}})</math></p> <p><b>FL version:</b> 0...200 m → min. conductivity <math>\geq 5 \mu\text{S/cm}</math></p> <p><b>Instrument equipped with empty pipe detection (EPD):</b> max. cable length = 10 m</p> <p>Minimum conductivity for demineralised water: generally <math>\geq 20 \mu\text{S/cm}</math></p> <div style="display: flex; align-items: center;">  <div> <p style="text-align: center;">Conductivity [<math>\mu\text{S/cm}</math>]</p>  <p style="text-align: center;">Cable length <math>L_{\text{max}}</math></p> </div> <div style="margin-left: 20px; writing-mode: vertical-rl; transform: rotate(180deg); font-size: small;">11043y33</div> </div>
<b>Ambient conditions</b>	
<i>Ambient temperature</i>	<p><math>-20\dots+60 \text{ }^\circ\text{C}</math> (Transmitter and sensor)</p> <ul style="list-style-type: none"> <li>An all-weather cover should be used to protect the housing from direct sunlight when mounting in the open. This is especially important in warmer climates and with high ambient temperatures.</li> <li>Due to the danger of the transmitter electronics overheating, the transmitter and sensor are to be mounted separately with high ambient and fluid temperatures (see Figure).</li> </ul> <div style="display: flex; align-items: center;">  <div style="margin-left: 20px;"> <p>Temperature range only for the remote version available.</p> <ul style="list-style-type: none"> <li><span style="display: inline-block; width: 15px; height: 10px; background-color: #e0e0e0; border: 1px solid black; margin-right: 5px;"></span> PTFE (Teflon)</li> <li><span style="display: inline-block; width: 15px; height: 10px; background-color: #808080; border: 1px solid black; margin-right: 5px;"></span> Soft rubber (EPDM)</li> <li><span style="display: inline-block; width: 15px; height: 10px; background-color: #404040; border: 1px solid black; margin-right: 5px;"></span> Hard rubber</li> </ul> </div> <div style="margin-left: 20px; writing-mode: vertical-rl; transform: rotate(180deg); font-size: small;">11043y34</div> </div>
<i>Storage temperature</i>	$-10\dots+50 \text{ }^\circ\text{C}$ (preferably at $+20 \text{ }^\circ\text{C}$ )
<i>Degree of protection (EN 60529)</i>	IP 67 (NEMA 4X) Option: IP 68 (NEMA 6P) for sensor A and F
<i>Shock and vibration resistance</i>	Acceleration up to 2 g / 2 h per day; 10...100 Hz
<i>Electromagnetic compatibility (EMC)</i>	According to EN 50081 Part 1 and 2 (interference emission) / EN 50082 Part 1 and 2 (interference immunity) as well as to NAMUR recommendations

## Technical Data

<b>Mechanical construction (continued)</b>	
<i>Materials (continued)</i>	<p><i>Process connections:</i></p> <p>Promag A    DIN    → Stainless steel 1.4404, PVDF                         ANSI    → 316L, PVDF                         JIS     → 316L, PVDF                         Threaded stub: 1.4435, PVC                         1.4404 / 316L</p> <p>Promag H    DIN    → Stainless steel 1.4571, St. 37-2                         ANSI    → A 105, 316L                         AWWA    → A 105, A 36                         JIS     → S20C, SUS 316 L</p> <p><i>Electrodes:</i></p> <p>Promag A    1.4435; Platinum/Rhodium 80/20; Titan;                         Hastelloy C-22; Tantalum</p> <p>Promag H    1.4435</p> <p>Promag F    1.4435; Platinum/Rhodium 80/20;                         Hastelloy C-22; Tantalum</p> <p><i>Gasket material:</i></p> <p>Promag A    Viton, Kalrez (optional), Silicone (aseptic version)                         EPDM, Silicone                         no gaskets (Lining = 'gasket')</p>
<i>Electrodes fitted</i>	<p>Promag A    Measuring, reference and empty pipe detection electrodes.                         As standard with 1.4435, Hastelloy C-22, Tantalum                         Option with Platinum/Rhodium</p> <p>Promag H    Measuring and empty pipe detection electrodes</p> <p>Promag F    Measuring, reference and empty pipe detection electrodes.                         As standard with 1.4435, Hastelloy C-22, Tantalum</p>
<i>CIP cleanable</i>	<p>Promag A    Yes (observe maximum temperature)                         Promag H    Yes (observe maximum temperature)                         Promag F    Yes (observe maximum temperature)</p>
<i>SIP cleanable</i>	<p>Promag A    No                         Promag H    Yes (observe maximum temperature)                         Promag F    No</p>
<i>Process connections</i>	<p><i>Promag A:</i>                         Internal and external thread, PVC adhesive coupling, hose connection, welded nipple, aseptic welded nipples for pipelines according to DIN 11850, Tri-Clamp, flange connection (DIN, ANSI, JIS).</p> <p><i>Promag H:</i>                         Welded nipples for OD tube, SMS, JIS, ISO and DIN 11850 tubes, DIN 11851 thread, SMS thread, ISO 2853 thread, Tri-Clamp, ISO 2852 connection.</p> <p><i>Promag F:</i>                         Flange connection (DIN, ANSI, JIS)</p>
<i>Electrical connection</i>	<ul style="list-style-type: none"> <li>• Wiring diagrams: see page 9 ff.</li> <li>• Cable specifications: see page 12</li> <li>• Galvanic isolation:                         All circuits for inputs, outputs, power supply and sensors are galvanically isolated from one another.</li> </ul>
<i>Cable entries</i>	<p><i>Power supply and signal cable (output):</i>                         Cable glands PG 13.5 (5...15 mm) or threads for cable glands 1/2" NPT, M20 x 1.5 (8...15 mm), G 1/2"</p> <p><i>Coil current cable and signal cable (remote version)</i></p> <p>Promag A: Cable glands PG 11 (5...12 mm) or threads for cable glands 1/2" NPT, M20 x 1.5 (8...15 mm), G 1/2"</p> <p>Promag H: Cable glands PG 13.5 (5...15 mm) or threads for cable glands 1/2" NPT, M20 x 1.5 (8...15 mm), G 1/2"</p> <p>Promag F: Cable glands PG 13.5 (5...15 mm) or threads for cable glands 1/2" NPT, M20 x 1.5 (8...15 mm), G 1/2"</p>

<b>User interface</b>	
<i>Operation</i>	On-site operation: All functions of the E+H operating matrix can be selected and changed using three keys (E, -, +).
<i>Display</i>	<ul style="list-style-type: none"> <li>- Eight character LC display</li> <li>- 11 display segments for indicating units and instrument status.</li> <li>- Damping of flow display can be adjusted: 0.5...20 s</li> </ul>
<i>Communication</i>	none
<b>Power supply</b>	
<i>Supply voltage / Frequency</i>	85...260 V AC, 45...65 Hz 20... 55 V AC, 45...65 Hz 16... 62 V DC
<i>Power consumption</i>	AC: <15 VA (incl. sensor) DC: <15 W (incl. sensor) Current at make (Promag 30 X / 24 V DC): <ul style="list-style-type: none"> <li>- max. 13.5 A (&lt; 100 µs)</li> <li>- max. 6 A (&lt; 5 ms)</li> </ul>
<i>Power supply failure</i>	Bridges minimum 1 power cycle (22 ms) <ul style="list-style-type: none"> <li>• EEPROM saves measuring system data on power failure (no batteries required).</li> <li>• DAT = replaceable data memory in which basic data of the sensor are stored: nominal diameter, SAPS (actual values), serial number, calibration factor, zero point, status EPD (yes/no), EPD calibration values.</li> </ul>
<b>Certificates and approvals</b>	
<i>Ex approvals</i>	Information on Ex versions (e.g. CENELEC, SEV, FM, CSA) can be supplied by your E+H sales center on request. All explosion protection data are given in separate documentation available on request.
<i>Sanitary version</i>	<ul style="list-style-type: none"> <li>- Sensor Promag A: 3A approval</li> <li>- Sensor Promag H (hygienic version): 3A approval and EHEDG tested</li> </ul>
<i>Custody transfer</i>	<p><i>Promag 31 F</i></p> <ul style="list-style-type: none"> <li>- PTB approval for custody transfer with cold water and wastewater (either for approval or approved for custody transfer)</li> <li>- Heat measurement approval, Swiss certification to OIML R72/R75</li> </ul> <p><i>Promag 31 H</i></p> <ul style="list-style-type: none"> <li>- PTB approval to DIN 19217 (OIML 117) for custody transfer with beer, original wort, milk.</li> </ul>
<i>CE mark</i>	By attaching the CE mark, Endress+Hauser confirms that the Promag 30 measurement system has been successfully tested and fulfils all legal requirements of the relevant CE directives.
<b>Order information</b>	
<i>Accessories</i>	<ul style="list-style-type: none"> <li>• Post mounting set for transmitter (remote version): Order No. 50076905</li> <li>• Wall mounting kit for Promag A sensor: Order No. 50064550</li> </ul>
<i>Supplementary documentation</i>	System Information Promag (SI 010D/06/en) Operating Manual Promag 30 (BA 039D/06/en) * Operating Manual Promag 31 F – Cold water (BA 041D/06/en) * Supplementary Ex documentation: CENELEC, SEV, FM, CSA  * Model '99
<b>Other standards and guidelines</b>	
EN 60529	Degree of protection by housing (IP code)
EN 61010	Protection Measures for Electronic Equipment for Measurement, Control, Regulation and Laboratory Procedures
EN 50081	Part 1 and 2 (interference emission)
EN 50082	Part 1 and 2 (interference immunity)
NAMUR	Association of Standards for Control and Regulation in the Chemical Industry
